4.1.3 TEST PROCEDURES

- a. The EUT was placed 0.4 meters from the conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). Other support units were connected to the power mains through another LISN. The two LISNs provide 50 ohm/ 50uH of coupling impedance for the measuring instrument.
- b. Both lines of the power mains connected to the EUT were checked for maximum conducted interference.
- c. The frequency range from 150kHz to 30MHz was searched. Emission levels under (Limit 20dB) was not recorded.

4.1.4 DEVIATION FROM TEST STANDARD

No deviation

4.1.5 TEST SETUP

Note: 1.Support units were connected to second LISN.
2.Both of LISNs (AMN) are 80 cm from EUT and at least 80 cm from other units and other metal planes support units.

For the actual test configuration, please refer to the related item – Photographs of the Test Configuration.

4.1.6 EUT OPERATING CONDITIONS

- a. Connected EUT with notebook system via control board and placed on testing table.
- b. The notebook system ran a test program (provided by manufacturer) to enable EUT under transmitting condition continuously at specific channel frequency.
- c. The necessary accessories enable the system in full functions.

4.2 RADIATED EMISSION MEASUREMENT

4.2.1 LIMITS OF RADIATED EMISSION MEASUREMENT

Emissions radiated outside of the specified bands, shall be according to the general radiated limits in 15.209 as following:

| FREQUENCIES (MHz) | FIELD STRENGTH (microvolts/meter) | MEASUREMENT DISTANCE (meters) |
|-------------------|-----------------------------------|-------------------------------|
| 0.009 ~ 0.490 | 2400/F(kHz) | 300 |
| 0.490 ~ 1.705 | 24000/F(kHz) | 30 |
| 1.705 ~ 30.0 | 30 | 30 |
| 30 ~ 88 | 100 | 3 |
| 88 ~ 216 | 150 | 3 |
| 216 ~ 960 | 200 | 3 |
| Above 960 | 500 | 3 |

NOTE:

- 1. The lower limit shall apply at the transition frequencies.
- 2. Emission level $(dBuV/m) = 20 \log Emission level (uV/m)$.
- 3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

NOTE: 1. The calibration interval of the above test instruments is 12 months. And the calibrations are traceable to NML/ROC and NIST/USA.

- 2. The horn antenna and HP preamplifier (model: 8449B) are used only for the measurement of emission frequency above 1GHz if tested.

- 4. The Industry Canada Reference No. IC 3789-6.
- 5. The FCC Site Registration No. is 447212.

4.2.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

NOTE:

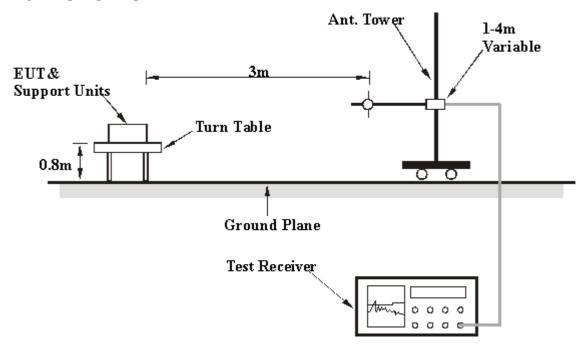

- 1. The resolution bandwidth of test receiver/spectrum analyzer is 120kHz for Quasi-peak detection at frequency below 1GHz.
- The resolution bandwidth is 1MHz and video bandwidth of test receiver/spectrum analyzer is 3MHz for Peak detection at frequency above 1GHz. The resolution bandwidth of test receiver/spectrum analyzer is 1 MHz for Average detection (AV) at frequency above 1GHz.
- 3. For measurement of frequency above 1000 MHz, the EUT was set 3 meters away from the interference-receiving antenna.

TEST MODE A FOR GFSK MODULATION

NOTE 1:

The band edge emission plot on the next page shows 59.44dBc between carrier maximum power and local maximum emission in restrict band (2.3760GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 95.35dBuV/m (Peak), so the maximum field strength in restrict band is 95.35 – 59.44= 35.91dBuV/m, which is under 74 dBuV/m limit.

Average value = 35.91 - 30.10= 5.81dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading -30.10.

NOTE 2:

The band edge emission plot on the next second page shows 44.64dBc between carrier maximum power and local maximum emission in restrict band (2.48460GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 92.82dBuV/m (Peak), so the maximum field strength in restrict band is 92.82 - 44.64 = 48.18dBuV/m, which is under 74 dBuV/m limit.

Average value = 48.18 - 30.10= 18.08dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading -30.10.

TEST MODE B FOR GFSK MODULATION

NOTE 1:

The band edge emission plot on the next page shows 59.44dBc between carrier maximum power and local maximum emission in restrict band (2.3760GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 100.86dBuV/m (Peak), so the maximum field strength in restrict band is 100.86 – 59.44= 41.42dBuV/m, which is under 74 dBuV/m limit.

Average value = 41.42 - 30.10= 11.32dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading -30.10.

NOTE 2:

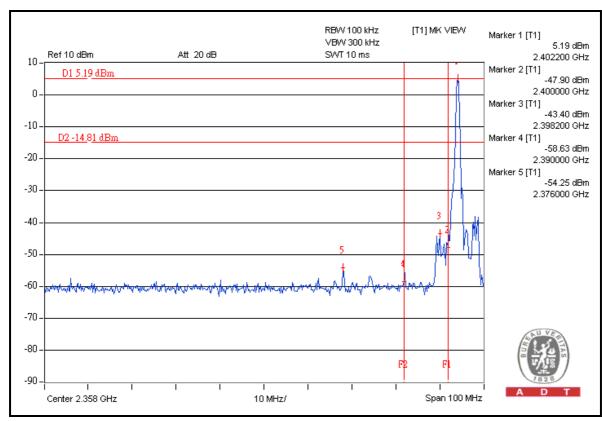

The band edge emission plot on the next second page shows 44.64dBc between carrier maximum power and local maximum emission in restrict band (2.48460GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 100.97dBuV/m (Peak), so the maximum field strength in restrict band is 100.97 - 44.64 = 56.33dBuV/m, which is under 74 dBuV/m limit.

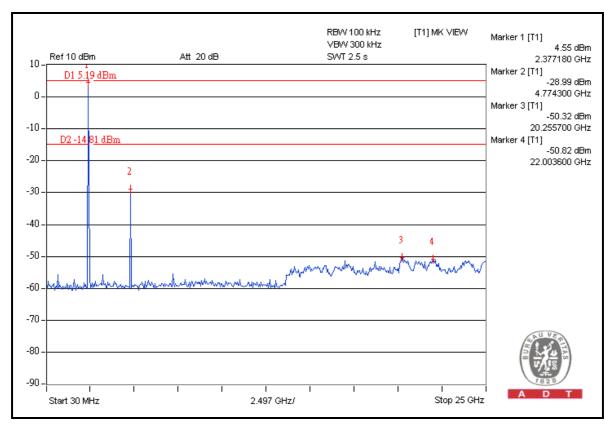

Average value = 56.33 - 30.10= 26.23dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

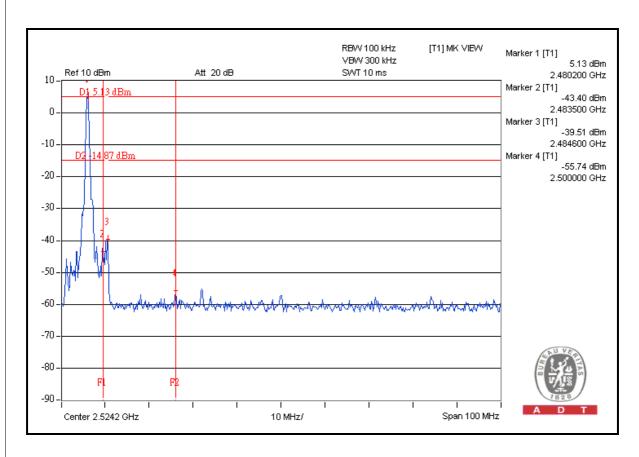

Average value = peak reading -30.10.

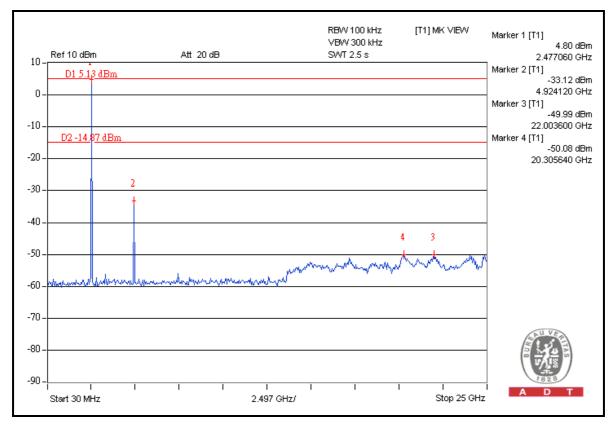

TEST MODE A FOR 8DPSK MODULATION

NOTE 1:

The band edge emission plot on the next page shows 57.35dBc between carrier maximum power and local maximum emission in restrict band (2.3864GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 93.08dBuV/m (Peak), so the maximum field strength in restrict band is 93.08 - 57.35 = 35.73dBuV/m, which is under 74 dBuV/m limit.

Average value = 35.73 - 30.10= 5.63dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading –30.10.

NOTE 2:

The band edge emission plot on the next second page shows 48.23dBc between carrier maximum power and local maximum emission in restrict band (2.4835GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 92.82dBuV/m (Peak), so the maximum field strength in restrict band is 91.05 - 48.23 = 42.82BuV/m, which is under 74 dBuV/m limit.

Average value = 42.82 - 30.10= 12.72dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading –30.10.

TEST MODE B FOR 8DPSK MODULATION

NOTE 1:

The band edge emission plot on the next page shows 57.35 dBc between carrier maximum power and local maximum emission in restrict band (2.3864 GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 98.93 dBuV/m (Peak), so the maximum field strength in restrict band is 98.93 - 57.35 = 41.58 dBuV/m, which is under 74 dBuV/m limit.

Average value = 41.58 - 30.10= 11.48dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

Average value = peak reading –30.10.

NOTE 2:

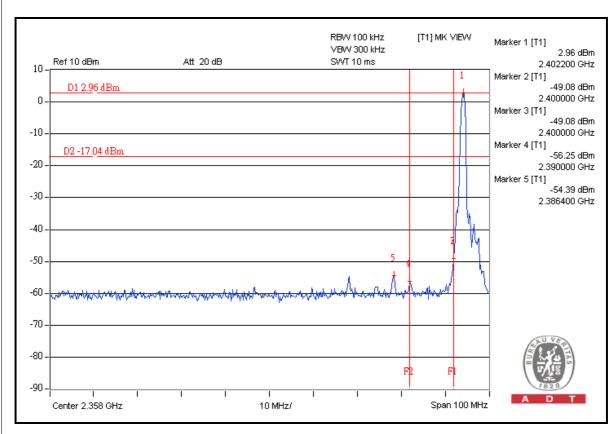

The band edge emission plot on the next second page shows 48.23dBc between carrier maximum power and local maximum emission in restrict band (2.4835GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 100.18dBuV/m (Peak), so the maximum field strength in restrict band is 100.18 - 48.23 = 51.95BuV/m, which is under 74 dBuV/m limit.

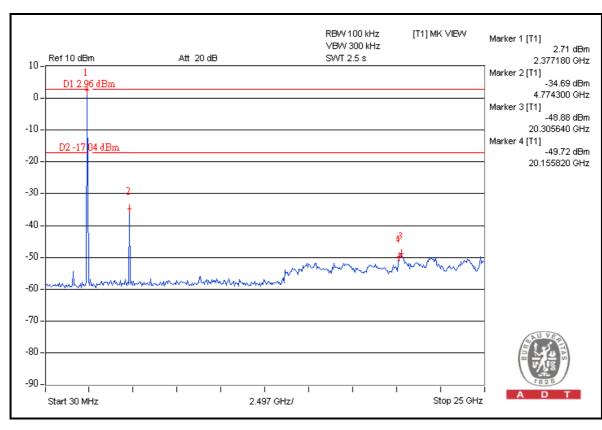

Average value = 51.95 - 30.10= 21.85dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle be equal to: 20log(3.125/100)= -30.1 dB.

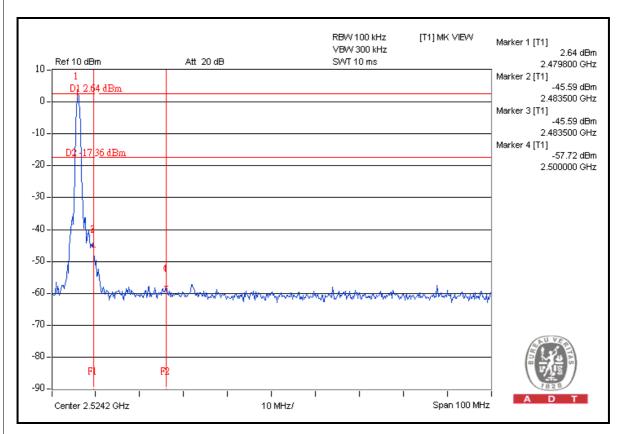

Average value = peak reading –30.10.
