Section 1: Equipment Under Test

1.1 Product Identification

The Equipment Under Test was identified as follows:

Qualcomm Gobi2000 with Serial Number: G2-P2B-11

11696 Sorrento Valley Road, Suite F, San Diego, CA 92121 Phone (858) 755-5525 - Fax (858) 452-1810

FCC ID: J9CGOBI2000 IC: 2723A-GOBI2000

1.2 Theory of Operation

The Gobi2000TM is the second-generation PCI ExpressTM Mini Card that enables notebook computer wireless data connectivity. This datacard solution delivers WWAN connectivity for the CDMA2000® 1X, 1x EV-DO, UMTS (HSDPA and HSUPA), and GSM/GPRS/EDGE protocols, plus GPS position location, in a single package. The complete Gobi2000 solution includes all hardware and software necessary for embedded wireless connectivity in notebook PCs.

The module will have the following features:

- CDMA2000 1xEV-DO data at 850 MHz and 1900 MHz with receive diversity support for both bands
- UMTS HSDPA and HSUPA data at 850 MHz, 900 MHz, Japan800 MHz, 1900 MHz, and 2100 MHz with diversity support for all 5 bands
- GSM/GPRS/EDGE data at 850 MHz, 900 MHz, 1800 MHz, and 1900 MHz
- GPS (switched into diversity path) at 1575 MHz
- Service-provider skins (Windows® application)
- Microsoft® Windows XP and Vista drivers
- APIs and SDKs
- Security and authentication
- Connectivity for an offboard USIM integrated circuit card (UICC)
- Connectivity for two offboard antennas (WWAN primary and diversity)
- Network Manager support for English, Portuguese, Spanish, French, German, Italian, and others as required by the carriers
- USB 2.0 high-speed interface

Section 2: Test Methodology

2.1 Test Standards

The tests documented in this report were performed in accordance with:

- FCC CFR 47 Part 2
- FCC CFR 47 Part 15
- FCC CFR 47 Part 22, Subpart H Cellular Radiotelephone Service
- FCC CFR 47 Part 24, Subpart E Broadband PCS
- Industry Canada, RSS-GEN (Issue 2)
- Industry Canada, RSS-132, Issue 2 (Cellular Telephones Employing New Technologies Operating in the Bands 824-849 MHz and 869-894 MHz)
- Industry Canada, RSS-133, Issue 3 (2 GHz Personal Communications Services)
- TIA/EIA 603C (2004)
- ANSI C63.4 (2003)

2.2 Antenna Substitution Method

- 1) Methodology Used: TIA/EIA-603 Clause 2.2.17
- 2) The Substitution Method is used for fundamental power levels and spurious emissions when RF emission signals are measured within 20 dB of the limit.
- 3) Formula Used to calculate the values:
 - a) Measured value + antenna factor + cable loss preamplifier = Max Level
 - b) Margin = Max level Limit
 - c) Signal Generator power level cable loss + antenna gain = ERP Part 22 or EIRP Part 24
 - d) Substituted Margin = ERP (or EIRP) Limit

Note: gain for dipole = 0; antenna factor is not the same as antenna gain

Note: The signal generator power level is the power required when transmitting into the substituting antenna to duplicate the Measured Value. Substituted margin is reported in 731 forms pertaining to certification grants and Class II Permissive Changes when a direct conducted power reading cannot be performed.

Section 3: Test Conditions

3.1 Specifications

The apparatus was assessed against the following specifications:

- FCC Part 22, Subpart H Cellular Radiotelephone Service
- FCC Part 24, Subpart E Broadband PCS
- Industry Canada, RSS-GEN Issue 2
- Industry Canada, RSS-132, Issue 2 (Cellular Telephones Employing New Technologies Operating in the Bands 824-849 MHz and 869-894 MHz)
- Industry Canada, RSS-133, Issue 3 (2 GHz Personal Communications Services)

3.2 Deviations From Laboratory Test Procedures

No deviations were made from laboratory test procedures.

3.3 Test Environment

All tests were performed under the following environmental conditions:

Temperature range : 13 – 18°C Humidity range : 45 - 91 % Pressure range : 86 - 106 kPa

Section 4: Observations

4.1 Modifications Performed During Assessment

No modifications were performed during assessment.

4.2 Record Of Technical Judgements

No technical judgements were made during the assessment.

4.3 EUT Parameters Affecting Compliance

The user of the apparatus could not alter parameters that would affect compliance.

4.4 Test Deleted

No Tests were deleted from this assessment.

4.5 Additional Observations

There were no additional observations made during this assessment.

Appendix A: Test Results

Para. No.: 2.1046 RF Power Output

§ 22.913 Effective radiated power limits.

The effective radiated power (ERP) of transmitters in the Cellular Radiotelephone Service must not exceed the limits in this section.

- (a) Maximum ERP. In general, the effective radiated power (ERP) of base transmitters and cellular repeaters must not exceed 500 Watts. However, for those systems operating in areas more than 72 km (45 miles) from international borders that:
- (1) Are located in counties with population densities of 100 persons or fewer per square mile, based upon the most recently available population statistics from the Bureau of the Census; or,
- (2) Extend coverage on a secondary basis into cellular unserved areas, as those areas are defined in §22.949, the ERP of base transmitters and cellular repeaters of such systems must not exceed 1000 Watts. The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts.

§ 24.232 Power and antenna height limits.

- (c) Mobile/portable stations are limited to 2 watts EIRP peak power and the equipment must employ means to limit the power to the minimum necessary for successful communications.
- (d) Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true peak measurement for the emission in question over the full bandwidth of the channel.

Test Procedure: ANSI C63.4 (2003) Clause 8

Para. No.: 2.1053 Field Strength of Spurious

§ 22.917 Emission limitations for cellular equipment.

- (a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.
- (b) Measurement procedure. Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

§ 24.238 Emission limitations for Broadband PCS equipment.

The rules in this section govern the spectral characteristics of emissions in the Broadband Personal Communications Service.

- (a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.
- (b) Measurement procedure. Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

Test Procedure: ANSI C63.4 (2003) Clause 8 **Test Conditions:**

| Sample Number: | G2-P2B-11 | Temperature: | 8-18°C |
|---------------------|--------------------|--------------|---------------|
| Date: | Dec. 16 & 18, 2008 | Humidity: | 53-88 % |
| Modification State: | See datasheets | Tester: | Rodel Rosolme |
| | | Laboratory: | Nemko SOATS |

Test Results: See attached Tables

Additional Observations:

 The Spectrum was searched up to the 10th Harmonic. Emissions within 20 dB of the limit were substituted by a signal generator and matching antenna and were shown to comply.
